Analysis of The Packet Captured

I have analysed the provided packet capture file using the free network analysis tool Wireshark.

I was able to put “http” into the filter field in order to filter the network traffic to only see HTTP packets.

This view let me see some interesting http GET requests, which indicate that the user specifically requests information.

Sub-task 1:

• *anz-logo.jpg and bank-card.jpg are two images that show up in the users network traffic.*

• *Extract these images from the pcap file and attach them to your report.*

I extracted the images using Wireshark HTTP filter and “Follow TCP Stream” feature. I clicked follow TCP Stream and converted the file into Raw file. I searched “ffd8” where the jpg file begins and “ffd9” where the jpg file ends. I selected and copied the codes between “ffd8” and “ffd9” to HxD tool. I then saved this as a jpg image.

Sub-task 2:

[Open in app](#)

Medium

 Search

 Write

• *Extract the images, include them and mention what is different about them in your report.*

The same process done in Sub-task 1 is repeated.

MAKE A 'PACT'

TO PROTECT YOUR VIRTUAL VALUABLES

PAUSE
before sharing your
personal information

Ask yourself, do I really need to give my information to this website or this person? If it doesn't feel right, don't share it.

CALL OUT
suspicious messages

Be aware of current scams. If an email, call or SMS seems unusual, check it through official contact points or report it.

ACTIVATE
two layers of security with
two-factor authentication

Use two-factor authentication for an extra layer of security to keep your personal information safe.

TURN ON
automatic
software updates

Set your software, operating system and apps to auto update to make sure you get the latest security features.

Report suspicious messages from ANZ:

Email hoax@cybersecurity.anz.com

Report fraudulent or unusual ANZ account activity:

137 028 / +61 3 8693 7153 (Corporate/Business Clients)

133 350 / +61 3 9683 8833 (Personal Banking Customers)

Australia and New Zealand Banking Group Limited (ANZ) ABN 11 005 357 522. Item No. 96184B 09/2018 AUJ22349

Sub-task 3:

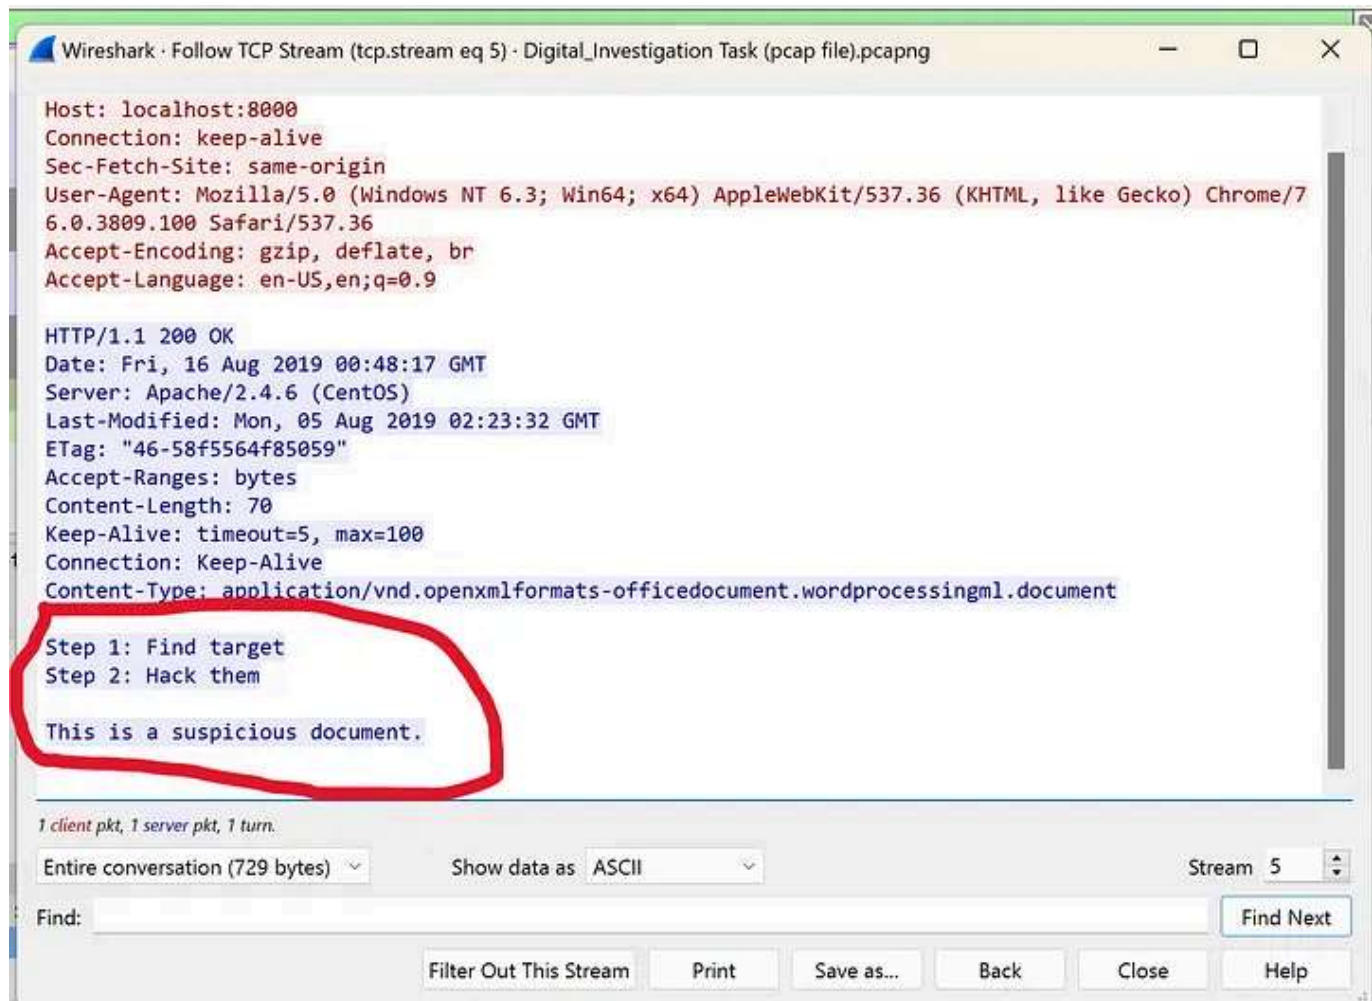

- The user downloaded a suspicious document called "how-to-commit-crimes.docx"
- Find the contents of this file and include it in your report.

On the TCP Stream, there is a message that reads:

Step 1: Find target

Step 2: Hack them

This is a suspicious document. (mmmmkay?)

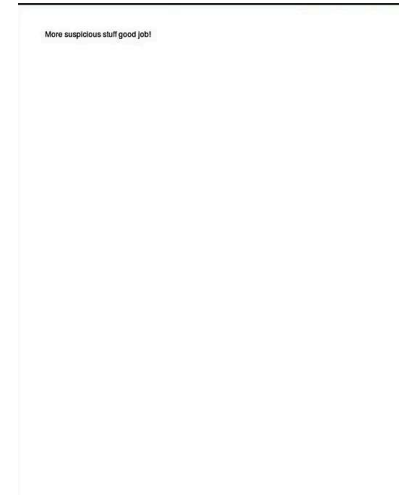

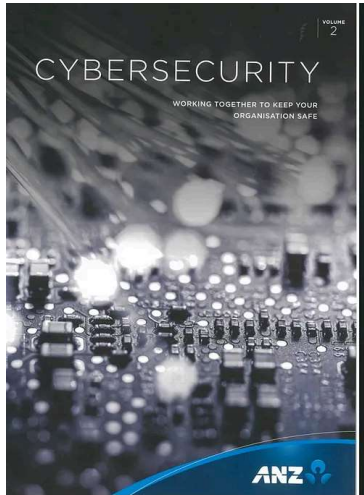

Sub-task 4:

- *The user accessed 3 pdf documents: ANZ_Document.pdf, ANZ_Document2.pdf, evil.pdf*
- *Extract and view these documents. Include images of them in your report.*

I extracted the documents using Wireshark HTTP filter and "Follow TCP Stream" feature. I clicked follow TCP Stream and converted the file into Raw file. I searched

“2550” where the pdf file begins and “0A25” where the pdf file ends. I selected and copied the codes between “2550” and “0A25” to HxD tool. I then saved this as a pdf document.

Sub-task 5:

- *The user also accessed a file called “hiddenmessage2.txt”*
- *What is the contents of this file? Include it in your report.*

The same process done in Sub-task 1 and Sub-task 2 is repeated.

Sub-task 6:

- *The user accessed an image called “atm-image.jpg”*
- *Identify what is different about this traffic and include everything in your report*

The same process done in Sub-task 1, Sub-task 2 and Sub-task 5 is repeated.

Sub-task 7:

- *The network traffic shows that the user accessed the image “broken.png”*
- *Extract and include the image in your report.*

Being in Base64, I tried base64 encode. I decoded it, then used the HxD tool and then saved as png file.

Sub-task 8:

- *The user accessed one more document called securepdf.pdf*

· Access this document include an image of the pdf in your report. Detail the steps to access it.

A zip file was found and there was a message at the end of the TCP Stream that says “Password is “secure”” I then used the Hex dump and HxD tool to save the file as zip file. The zip file contained a rawpdf.pdf file which required a password(secure) to open.

It was such an educative internship.
